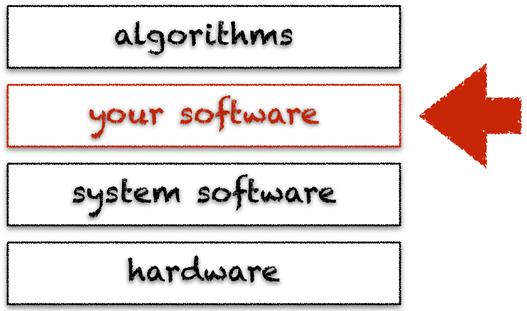
classes, objects & methods

learning objectives



- learn about encapsulation and abstraction
- learn about classes, objects and methods
- learn how to create your own classes
- learn about modularization and code reuse

software engineering

an algorithm focuses on a specific computational procedure that solve a particular problem

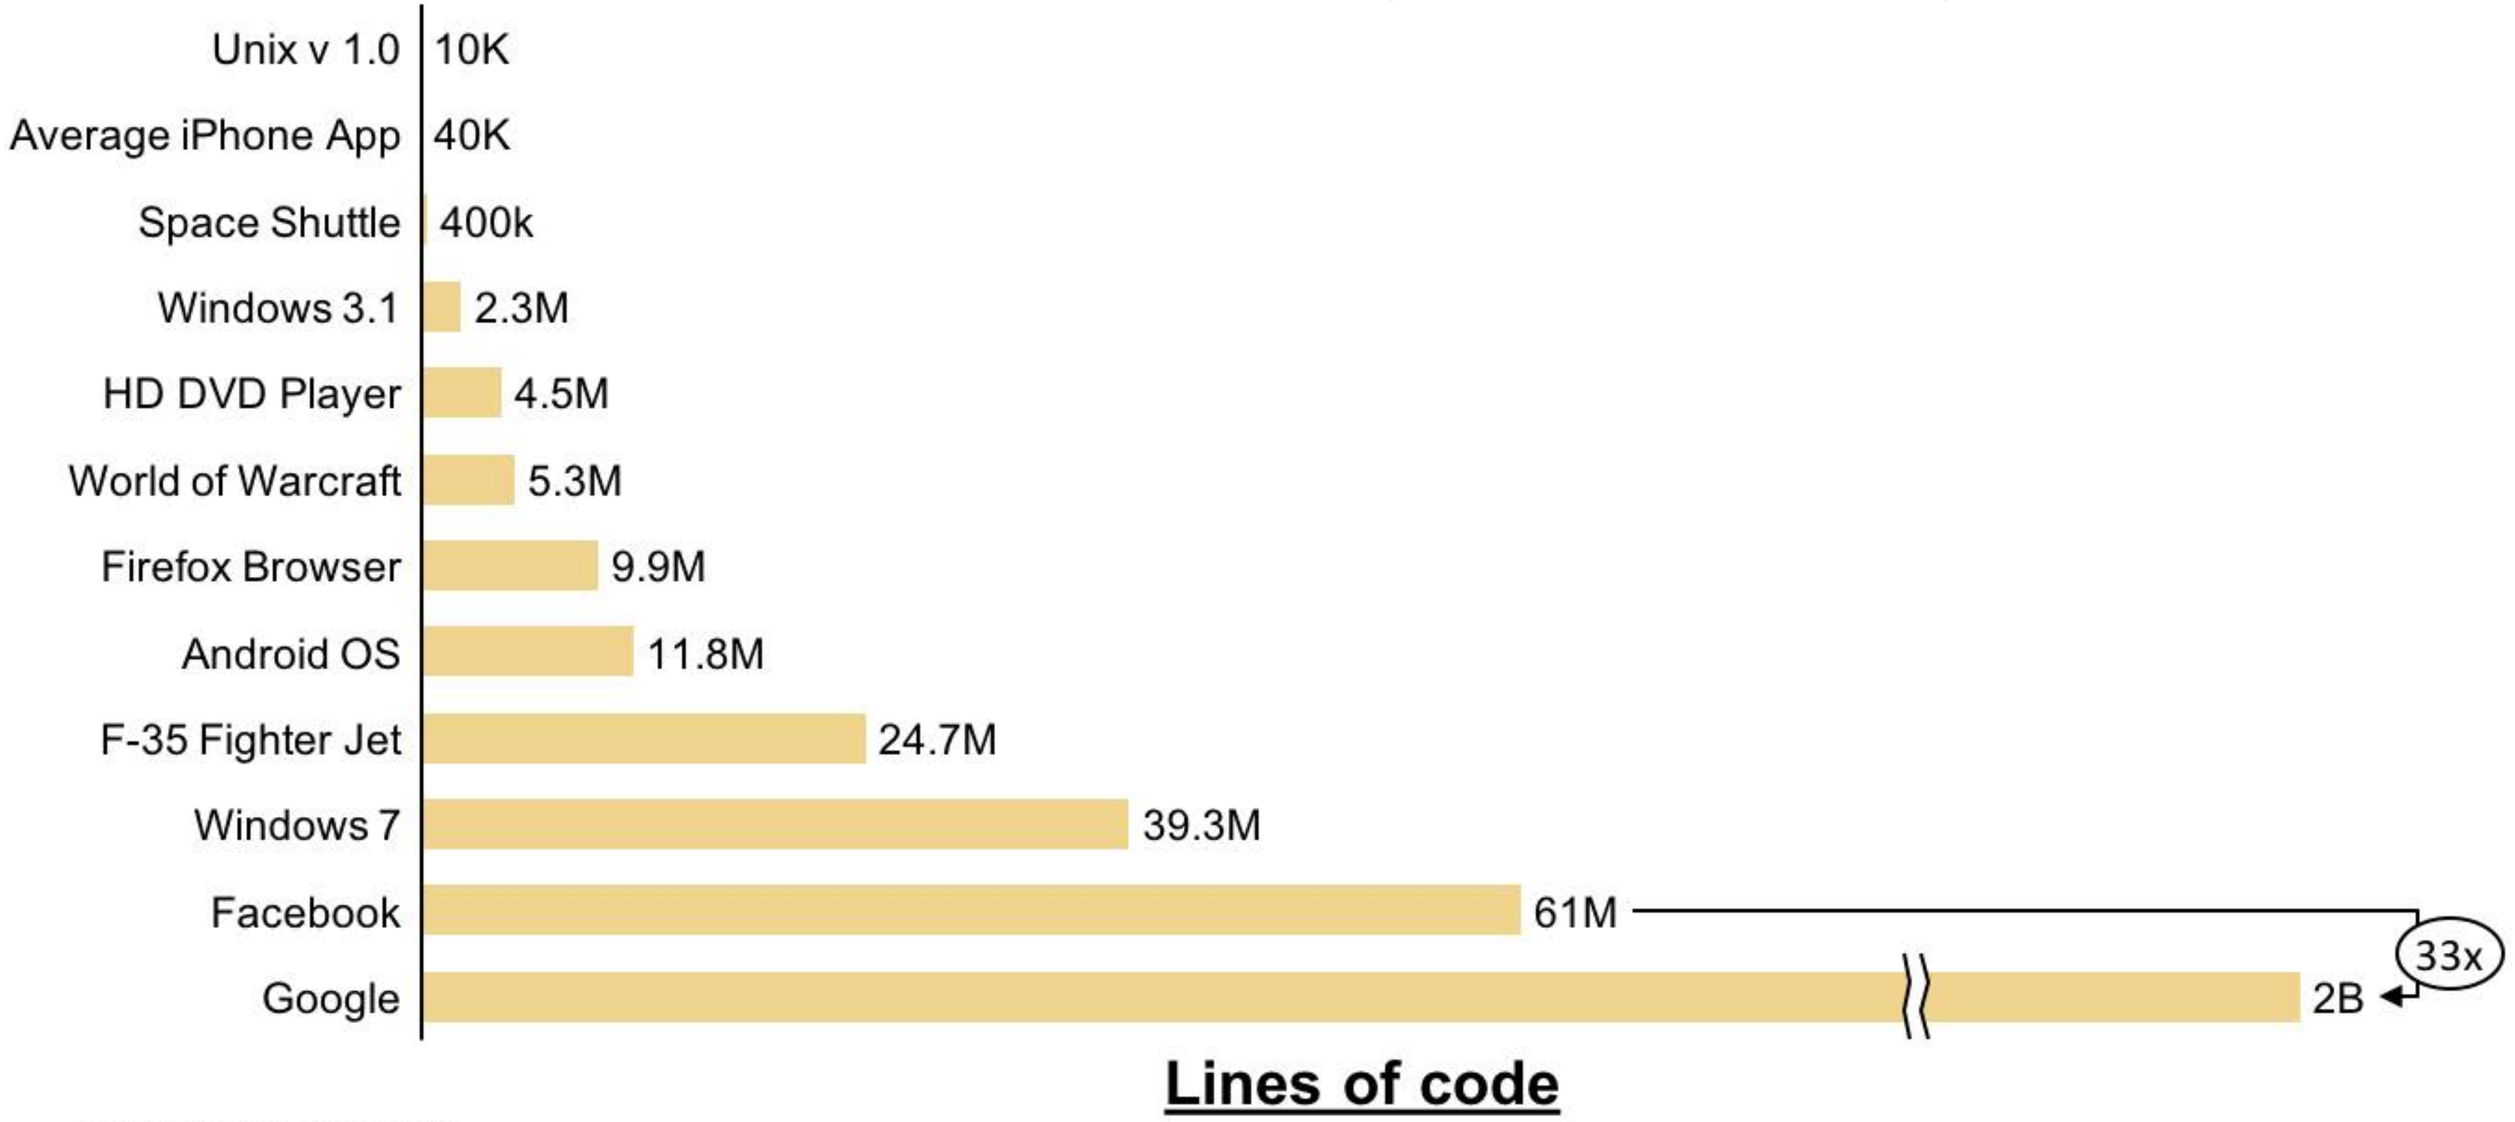
a complete program is however composed of many such algorithms, resulting in many lines of code

the linux kernel consists of 15+ million lines of code*
the google codebase consists of 2+ billion lines of code*

*January 2018

we need software engineering tools to manage this complexity

software engineering



Source: thenextweb.com

software engineering

software engineering tools are of different kinds, e.g., methodologies (agile), abstract notations (uml), source-oriented tools (ide, git), programming language constructs that help encapsulate complexity, e.g., objects, functions, etc.

in this course, we are mainly interested in programming language constructs, in particular objects and functions

today we focus on classes, objects and methods

this is known as the object-oriented approach

what's an objects?

represents particular "things" from the real world, or from some problem domain (e.g., "my blue rocking chair")

What's a class?

represents
all objects of
a given kind,
e.g., "chairs"

specification vs implementation

what it does

how it does it

specification viewpoint

the viewpoint of someone simply wanting to use objects (not design them)

no need to know how objects are built to use them, only what can be done with them

encapsulation principle: allows us to hide (encapsulate) the complexity of objects

a class specifies the set of common behaviors offered by objects (instances) of that class

methods & parameters

```
chair.rotate(45)
```

object have methods (operations) that can be invoked (called) and define their possible behaviors

when we want an object to do something for us, we call one of its methods

the set of (public) methods of an object can be seen as its contract with the world (its specification)

methods & parameters

```
chair.rotate(45)
```

methods may have
parameters to pass
additional information
needed to execute it

implementation viewpoint

how it does it

the implementation viewpoint is concerned with how an object actually fulfills its specification (its contract)

the fields and methods define how the object will behave and are defined by its

class

instances

many instances (objects) can be created from a single class

the class can be seen as a kind of object factory (or a mold)

fields

the source code of classes defines the attributes (fields) and methods all objects of the class have

class Chair	
color	(string)
model	(string)
isBroken	(boolean)
age	(integer)

field values

each object stores its own values for each field

field values represent the object's state

instance myChair	
color	"green"
model	"shell"
isBroken	false
age	5

two chair instances

class Chair

color	(string)
model	(string)
isBroken	(boolean)
age	(integer)

instance myFirstChair

color	"brown"
model	"wood"
isBroken	false
age	50

instance mySecondChair

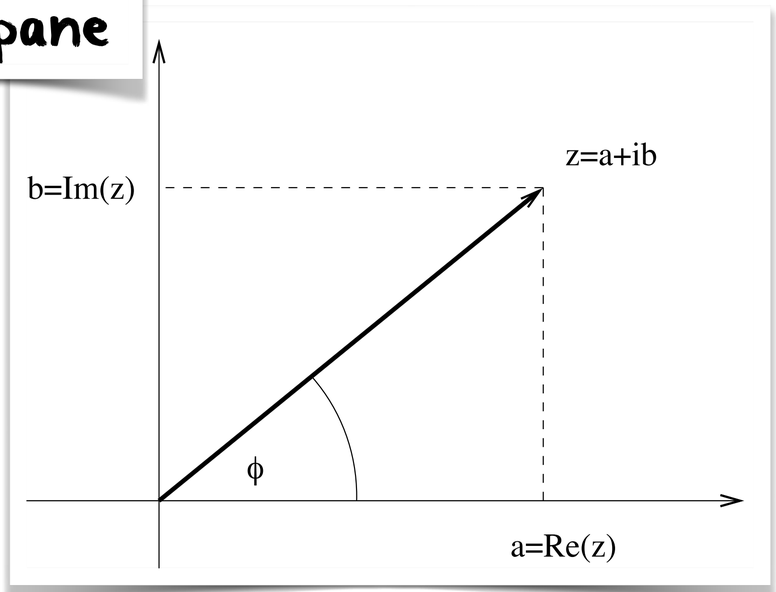
color	"green"
model	"shell"
isBroken	false
age	5

complex numbers quick reminder

$$z = a + ib$$

$$\begin{aligned} with \quad i &= \sqrt{-1} \\ a &= \mathrm{Re}\,(z) \\ b &= \mathrm{Im}\,(z) \end{aligned}$$

complex pane



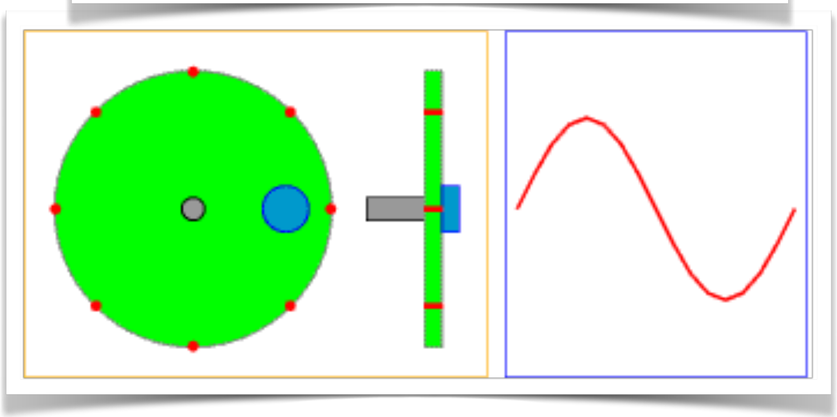
$$\tan\phi = \frac{\mathrm{Im}\,(z)}{\mathrm{Re}\,(z)}$$

$$z = |z|\,(\cos\phi + i\sin\phi)$$

$$e^{i\phi} = \cos\phi + i\sin\phi$$

$$z = |z|e^{i\phi}$$

intuitive interpretation



complex numbers quick reminder

addition $(a+bi)+(c+di)=(a+c)+(b+d)i$

subtraction $(a+bi)-(c+di)=(a-c)+(b-d)i$

multiplication $(a+bi)(c+di)=(ac-bd)+(bc+ad)i$

```
public class Complex {
  public final double re;
  public final double im;

  public Complex(double re, double im) { this.re = re; this.im = im; }

  public Complex add(Complex other) {
    return new Complex(this.re + other.re, this.im + other.im);
  }

  public Complex subtract(Complex other) {
    return new Complex(this.re - other.re, this.im - other.im);
  }

  public Complex multiply(Complex other) {
    return new Complex(this.re * other.re - this.im * other.im,
                       this.im * other.re + this.re * other.im);
  }
}
```

```
Complex z1 = new Complex(2, -1);
Complex z2 = new Complex(2, -4);

Complex z = z1.add(z2);
System.out.println(z1 + " + " + z2 + " = " + z);

z = z1.subtract(z2);
System.out.println(z1 + " - " + z2 + " = " + z);

z = z1.multiply(z2);
System.out.println(z1 + " * " + z2 + " = " + z);
```

```
2-i + 2-4i = 4-5i
2-i - 2-4i = 3i
2-i * 2-4i = -10i
```

complex numbers quick reminder

addition $(a+bi)+(c+di)=(a+c)+(b+d)i$

subtraction $(a+bi)-(c+di)=(a-c)+(b-d)i$

multiplication $(a+bi)(c+di)=(ac-bd)+(bc+ad)i$

```
class Complex(object):
    def __init__(self, re, im):
        self.re = re
        self.im = im

    def add(self, other):
        return Complex(self.re + other.re,
                       self.im + other.im)

    def sub(self, other):
        return Complex(self.re - other.re,
                       self.im - other.im)

    def mul(self, other):
        return Complex(self.re * other.re - self.im * other.im,
                       self.im * other.re + self.re * other.im)
```

```
z1 = Complex(2,-1)
z2 = Complex(2,-4)

z = z1.add(z2)
print("{0} + {1} = {2}".format(z1,z2,z))

z = z1.sub(z2)
print("{0} - {1} = {2}".format(z1,z2,z))

z = z1.mul(z2)
print("{0} * {1} = {2}".format(z1,z2,z))
```

```
2-i + 2-4i = 4-5i
2-i - 2-4i = 3i
2-i * 2-4i = -10i
```

complex numbers quick reminder

addition $(a+bi)+(c+di)=(a+c)+(b+d)i$

subtraction $(a+bi)-(c+di)=(a-c)+(b-d)i$

multiplication $(a+bi)(c+di)=(ac-bd)+(bc+ad)i$

operator overloading

```
class Complex(object):
    def __init__(self, re, im):
        self.re = re
        self.im = im

    def __add__(self, other):
        return Complex(self.re + other.re,
                       self.im + other.im)

    def __sub__(self, other):
        return Complex(self.re - other.re,
                       self.im - other.im)

    def __mul__(self, other):
        return Complex(self.re * other.re - self.im * other.im,
                       self.im * other.re + self.re * other.im)
```

```
z1 = Complex(2,-1)
z2 = Complex(2,-4)

z = z1 + z2
print("{0} + {1} = {2}".format(z1,z2,z))

z = z1 - z2
print("{0} - {1} = {2}".format(z1,z2,z))

z = z1 * z2
print("{0} * {1} = {2}".format(z1,z2,z))
```

```
2-i + 2-4i = 4-5i
2-i - 2-4i = 3i
2-i * 2-4i = -10i
```

complex numbers

no operator overloading in java

BUT

method overloading: yes

```
public class Complex {
  public final double re;
  public final double im;
  ⋮
  public Complex add(Complex other) {
    return new Complex(this.re + other.re, this.im + other.im);
  }
  ⋮
  public Complex add(double other) {
    return new Complex(this.re + other, this.im);
  }
  ⋮
}
```

```
Complex z1 = new Complex(2, -1);
Complex z2 = new Complex(2, -4);

Complex z = z1.add(z2);
System.out.println(z1 + " + " + z2 + " = " + z);

double d = 10;
z = z1.add(10);
System.out.println(z1 + " + " + d + " = " + z);
```

```
2-i + 2-4i = 4-5i
2-i - 2-4i = 3i
2-i * 2-4i = -10i
```

class declaration

class declaration

```
public class Complex {
  ⋮
```

constructor

```
  public Complex(double re, double im) { this.re = re; this.im = im; }
```

method

```
  public Complex add(Complex other) {
    return new Complex(this.re + other.re, this.im + other.im);
  }
  ⋮
```

method overloading

```
  public Complex add(double other) {
    return new Complex(this.re + other, this.im);
  }
}
```

class declaration

```
class Complex(object):
```

constructor

```
    def __init__(self, re, im):
        self.re = re
        self.im = im
```

method

```
    def add(self, other):
        return Complex(self.re + other.re,
                       self.im + other.im)
```

operator overloading

```
    def __add__(self, other):
        return Complex(self.re + other.re,
                       self.im + other.im)
```

abstraction & modularization

modularization consists in dividing a complex object into elemental objects that can be developed independently

the encapsulation offered by objects is the cornerstone of modularization because it hides implementation details

once elemental objects have been developed and tested, they can be assembled into a more complex object

this is known as code reuse

abstraction & modularization

example of a digital clock

one four-digit display?

OR

two two-digit displays?

NumberDisplay class

```
public class NumberDisplay {
    private int limit;
    private int value;

    public NumberDisplay(int limit, int value){
        this.limit = limit;
        this.value = value;
    }
    public NumberDisplay(int limit){
        this(limit, 0);
    }
    public int get() { return value; }
    public void set(int value) {
        this.value = value;
    }
    public void increment(){
        value = (value + 1) % limit;
    }
    public String toString(){
        if(value < 10) { return "0" + value; }
        else { return "" + value; }
    }
}
```

```
var number = new NumberDisplay(24);
System.out.println("number = " + number);

number.set(22);
System.out.println("number = " + number);

number.increment();
System.out.println("number = " + number);

number.increment();
System.out.println("number = " + number);
```

```
number = 00
number = 22
number = 23
number = 00
```

ClockDisplay class

```
public class ClockDisplay {
    private NumberDisplay hours;
    private NumberDisplay minutes;
    private String displayString;

    public ClockDisplay(){
        hours = new NumberDisplay(24,0);
        minutes = new NumberDisplay(60, 0);
    }
    public void timeTick(){
        minutes.increment();
        if(minutes.get() == 0) {
           hours.increment();
        }
    }
    public void set(int hours, int minutes) {
        this.hours.set(hours);
        this.minutes.set(minutes);
    }
    public String toString(){
        return hours + ":" + minutes;
    }
}
```

```
var clock = new ClockDisplay();
System.out.println("clock = " + clock);

clock.set(10,58);
System.out.println("clock = " + clock);

clock.timeTick();
System.out.println("clock = " + clock);

clock.timeTick();
System.out.println("clock = " + clock);

clock.set(23,59);
System.out.println("clock = " + clock);

clock.timeTick();
System.out.println("clock = " + clock);
```

```
clock = 00:00
clock = 10:58
clock = 10:59
clock = 11:00
clock = 23:59
clock = 00:00
```
